Re: Software Engineer / Full-Stack Developer

Dear Hiring Manager,

I am a final-year Computer Science student (B.Tech, 2027) applying for software engineering roles. I build full-stack systems where correctness, security and measurable performance are part of the design, and I am looking for a team that holds its software to the same standard.

My main project, **PayFlow**, is a payment processing and settlement engine built with TypeScript, Express and PostgreSQL. I designed it around its failure modes: idempotency keys backed by a unique index and a race handler, `SELECT … FOR UPDATE` row locks so concurrent captures settle exactly once, and refunds serialized against the remaining balance. Settlement math — a 2% platform fee plus 18% GST — lives in a pure, unit-tested service, webhook delivery is HMAC-SHA256 signed with tracked retries, and the flow is covered by 46 unit and integration tests, including concurrent capture and refund races. It runs live with Swagger documentation and a browser sandbox.

That same approach carried into my internships. At **Swaniki**, I shipped the company's seven-page Next.js and TypeScript marketing site, with typed content models, sitemap and metadata for search, and responsive Tailwind layouts. At **Code Booster**, I built five or more responsive client pages and standardized a shared component library. On **Saffron & Stove**, a recipe PWA, I cut third-party API calls by roughly 70% through caching and debouncing and scored 95 on Lighthouse Accessibility. The pattern is consistent: keep credentials server-side, validate inputs, test the failure modes, and document the API.

I am based in Durg, India and open to relocating to Hyderabad or working remotely. I would welcome the chance to walk through PayFlow's concurrency model or any of the projects above, and to learn what your team is building next.

Sincerely,

B. Yochna Rao
